

FEAR OF FLYING

Many people have a deeply ingrained fear of flying. Many of them share in common is a preoccupation with plane crashes, airplane safety, and the risk of death or injury.

1 in 3 adult Americans is either:

- Anxious about flying
- Afraid to fly

Reasons people were afraid to fly:

0.04 deaths
per 100 million miles

0.01 deaths
per 100 million miles

Taking **1 flight a day**, on average it will take **55,000 years** before being involved in a fatal crash

Only **1.4%** of crashes result in a fatality

Even as the number of flights increases year over year, the overall number of airline accidents continues to decrease due to ever improving safety features. Not only is flying safer than it's ever been, it continues to become safer every year.
